

RADIOLOGY EXAMINATION REPORT

February 22, 2026 at 09:51 PM

PATIENT ID

MRN-851834

EXAM TYPE

Chest X-Ray (PA/Lateral)

CLINICAL INDICATION / HISTORY

Not provided.

FINDINGS

No data available.

IMPRESSION

! In comparison with the study of [DATE], there is little change and no cardiopulmonary disease.

! Again there is extensive opacification involving much of the left hemithorax with loss in the left lower lobe and pleural fluid.

! The right lung is essentially clear except for a small area of increased opacity medially.

! This could represent merely atelectatic changes.

! However, in the appropriate clinical setting, supervening pneumonia cannot be excluded.

"Findings: As compared to the previous radiograph, the patient has received a nasogastric tube.

! The tip of the tube projects over the middle parts of the stomach.

! No evidence of complications, notably no pneumothorax.

! Unchanged appearance of the cardiac silhouette and of the right lung.

! At the time of dictation and observation, 9: 08 a.m., on [NAME] 11, the patient, a 45-year-old female, was paged for notification.

! Impression as to whether the patient should undergo CT examination cannot be given.

'Findings were discussed by telephone with Dr. [NAME] @ [NAME] at 10: 30 a.m.

! On the day of the exam, the NG tube had been removed.

RECOMMENDATIONS

- Clinical correlation is recommended.
- Follow-up imaging may be warranted based on clinical context.
- Consult attending physician for treatment decisions.
